

One accountable integrator for private AI, from software to data centre

Five components that work together or stand alone, for clients and partners.

The five components of FederatedOne

Federated Agentis

A

- A complete AI stack, from KV-cache offload to local model serving, enterprise integrations and the agent platform.
- Multi-tenant build, out of the box, with security and governance built in.
- Syntax on AgentStation (Pro Suite) on an on-premises appliance inside your own network.
- Cited research across large document sets, with Word, PDF, PowerPoint and Excel output.
- Agents, routines and a meeting notetaker, with human approval gates.
- Role-based access, metering and an audit trail, mapped to ISO 27001, GDPR and the EU AI Act.

MiPhi

Federated Build

B

- A build team that realises any agentic tool you need, on top of Agentis.
- Examples: tender and bid-response assistants, technical documentation search.
- Integrated with your tools, under the same approval gates and audit trail.

Any tool

idea to working agent

Federated Cloud

C

- GPU servers with MiPhi aiDAPTIV+ built in, extending GPU memory using flash inside the box.
- Larger models, longer context, more users on the same GPUs.
- Sessions that outgrow GPU memory spill onto in-box flash instead of failing: aiDAPTIV+ Link adds capacity, aiDAPTIV+ Cache keeps it responsive.
- Enterprise NVIDIA GPUs in your own data centre, sized to the workload and shared across business units.

extension, in the box

Federated DC

D

The data centre offering to run your private cloud or on-premises build: hosting, power, cooling, networking and security, under your control.

Private

under your control

Federated Ecosystem

E

Bridges partners and clients: a trusted network of vendors, integrators and software builders for clients, and access to clients and a governed platform for partners.

Connected

partners and clients

Components can be combined or taken one at a time. Gains depend on workload and configuration.
